objects

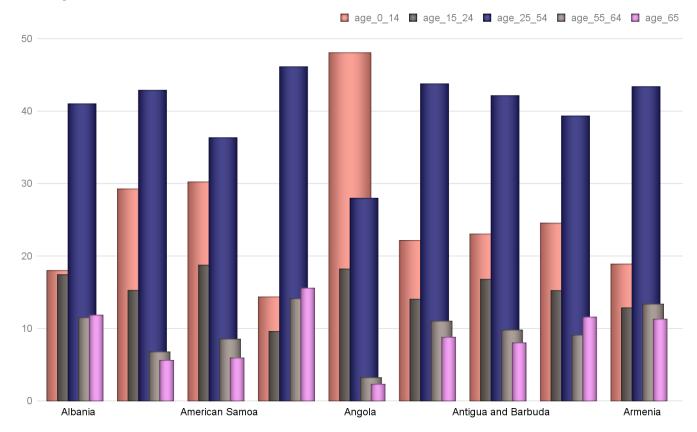

class docx.document.Document[source]

WordprocessingML (WML) document.

Not intended to be constructed directly. Use docx.Document() to open or create a document.

Altersverteilung für ausgewählte Länder nach WHO: Albania, Algeria, American Samoa, Andorra, Angola, Anguilla, Antigua and Barbuda, Argentina, Armenia

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

Return a heading paragraph newly added to the end of the document.

The heading paragraph will contain text and have its paragraph style determined by level. If level is 0, the style is set to Title. If level is 1 (or omitted), Heading 1 is used. Otherwise the style is set to Heading {level}. Raises ValueError if level is outside the range 0-9.

 $add_page_break()$

Return newly object containing only a page break.

Text Block №2

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

Return a paragraph newly added to the end of the document, populated with text and having paragraph style style. text can contain tab $(\t t)$ characters, which are converted to the appropriate XML form for a tab. text can also include newline $(\t n)$ or carriage return $(\t r)$ characters, each of which is converted to a line break.

add_picture(image_path_or_stream, width=None, height=None)

Return a new picture shape added in its own paragraph at the end of the document. The picture contains the image at image_path_or_stream, scaled based on width and height. If neither width nor height is specified, the picture appears at its native size. If only one is specified, it is used to compute a scaling factor that is then applied to the unspecified dimension, preserving the aspect ratio of the image. The native size of the picture is calculated using the dots-per-inch (dpi) value specified in the image file, defaulting to 72 dpi if no value is specified, as is often the case.

add_section(start_type=2)

Tabelle Nº2

Altersverteilung für ausgewählte Länder nach WHO: Aruba, Australia, Austria, Azerbaijan, Bahamas, The, Bahrain, Bangladesh, Barbados, Belarus, Belgium

| | Gesamt Population | Altersarunnen | | | | | |
|--|----------------------|-------------------|------------|-------|-------|-------|--|
| The second secon | Median | 0-14 | 15-24 | 25-54 | 55-64 | 65+ | |
| Aruba | 39.3 | 17.64 | 12.78 | 41.72 | 14.28 | 13.59 | |
| Australia | 38.7 | 17.8 | 12.79 | 41.45 | 11.83 | 16.14 | |
| Austria | 44.0 | 14.01 | 11.07 | 42.42 | 13.23 | 19.26 | |
| Azerbaijan | 31.3 | 22.95 | 14.84 | 45.39 | 10.17 | 6.64 | |
| Bahamas, The | 32.0 | 22.55 | 16.4 | 44.14 | 9.16 | 7.75 | |
| Bahrain | 32.3 | 19.08 | 15.65 | 56.04 | 6.28 | 2.95 | |
| Bangladesh | 26.7 | 27.76 | 19.36 | 39.73 | 6.93 | 6.23 | |
| Barbados | 38.6 | 17.97 | 12.74 | 44.06 | 13.43 | 11.81 | |
| Belarus | 40.0 | 15.78 | 10.29 | 44.76 | 14.21 | 14.95 | |

| | © Dr. Alexander V | Vagner. All Right | s Reserved | | | | |

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

add_table(rows, cols, style=None)

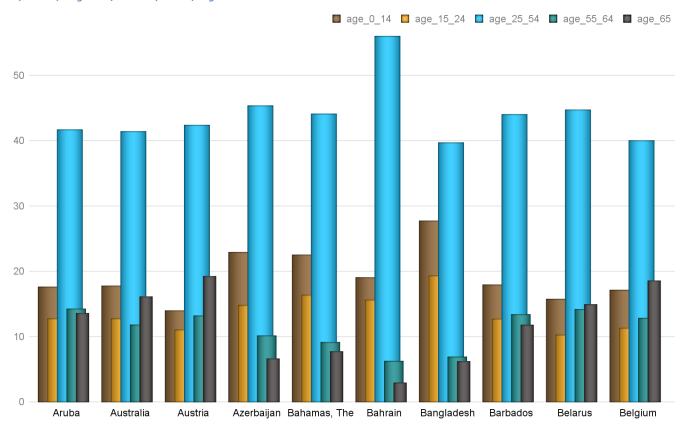

Add a table having row and column counts of rows and cols respectively and table style of style style may be a paragraph style object or a paragraph style name. If style is None, the table inherits the default table style of the document.

 $core_properties$

A CoreProperties object providing read/write access to the core properties of this document.

Altersverteilung für ausgewählte Länder nach WHO: Aruba, Australia, Austria, Azerbaijan, Bahamas, The, Bahrain, Bangladesh, Barbados, Belarus, Belgium

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

An InlineShapes object providing access to the inline shapes in this document. An inline shape is a graphical object, such as a picture, contained in a run of text and behaving like a character glyph, being flowed like other text in a paragraph.

paragraphs

A list of instances corresponding to the paragraphs in the document, in document order. Note that paragraphs within revision marks such as <w:ins> or <w:del> do not appear in this list.

part

Text Block №3

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

save(path_or_stream)

Save this document to path_or_stream, which can be either a path to a filesystem location (a string) or a file-like object.

sections

object providing access to each section in this document.

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

 $\label{eq:Absolute} A \ \ object\ providing\ access\ to\ the\ document-level\ settings\ for\ this\ document.$

styles

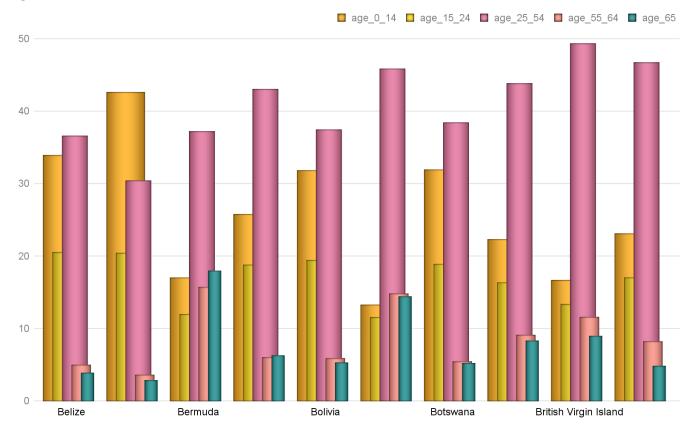

A object providing access to the styles in this document.

tables

Grafik №3

Altersverteilung für ausgewählte Länder nach WHO: Belize,Benin,Bermuda,Bhutan,Bolivia,Bosnia and Herzegovina,Botswana,Brazil,British Virgin Islands,Brunei

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

objects

Each Document object provides access to its CoreProperties object via its core_properties attribute. A CoreProperties object provides read/write access to the so-called core properties for the document. The core properties are author, category, comments, content_status, created, identifier, keywords, language, last_modified_by, last_printed, modified, revision, subject, title, and version.

Each property is one of three types, str, datetime.datetime, or. String properties are limited in length to 255 characters and return an empty string ('') if not set. Date properties are assigned and returned as datetime.datetime objects without timezone, i.e. in UTC. Any timezone conversions are the responsibility of the client. Date properties return None if not set.

python-docx does not automatically set any of the document core properties other than to add a core properties part to a presentation that doesn't have one (very uncommon). If python-docx adds a core properties part, it contains default values for the title, last_modified_by, revision, and modified properties. Client code should update properties like revision and last_modified_by if that behavior is desired.

Text Block №4

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

author

string - An entity primarily responsible for making the content of the resource.

category

string-A categorization of the content of this package. Example values might include: Resume, Letter, Financial Forecast, Proposal, or Technical Presentation.

Tabelle №4

Altersverteilung für ausgewählte Länder nach WHO: Bulgaria,Burkina Faso,Burma,Burundi,Cabo Verde,Cambodia,Cameroon,Canada,Cayman Islands,Central African Republic

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

 $string-An\ account\ of\ the\ content\ of\ the\ resource.$

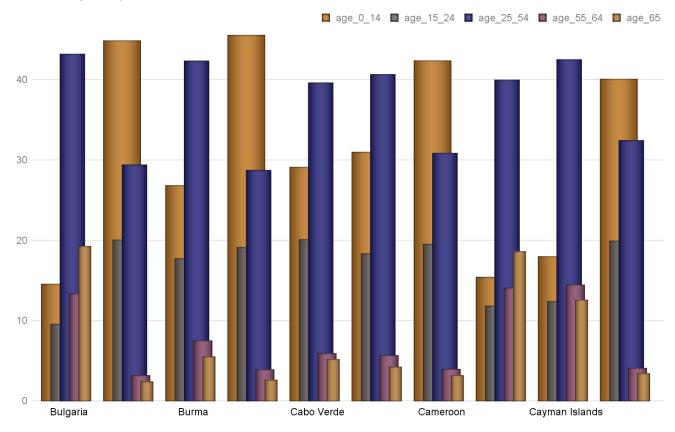

content_status

string - completion status of the document, e.g. 'draft'

created

Altersverteilung für ausgewählte Länder nach WHO: Bulgaria, Burkina Faso, Burma, Burundi, Cabo Verde, Cambodia, Cameroon, Canada, Cayman Islands, Central African Republic

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

identifier

string - An unambiguous reference to the resource within a given context, e.g. ISBN.

keywords

string – descriptive words or short phrases likely to be used as search terms for this document

Text Block №5

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

string - language the document is written in

 $last_modified_by$

string - name or other identifier (such as email address) of person who last modified the document

last_printed

Tabelle №5

Altersverteilung für ausgewählte Länder nach WHO: Chad, Chile, China, Colombia, Comoros, Congo, Democratic Republic of the, Congo, Republic of the, Cook Islands, Costa Rica, Cote divoire

| | Gesamt Population | Altersarunnen | | | | | | |
|-----------------------|----------------------|------------------|------------|-------|-------|-------------|--|--|

| | © Dr. Alexander W | agner. All Right | s Reserved | | | | | |

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

modified

datetime - time the document was last modified

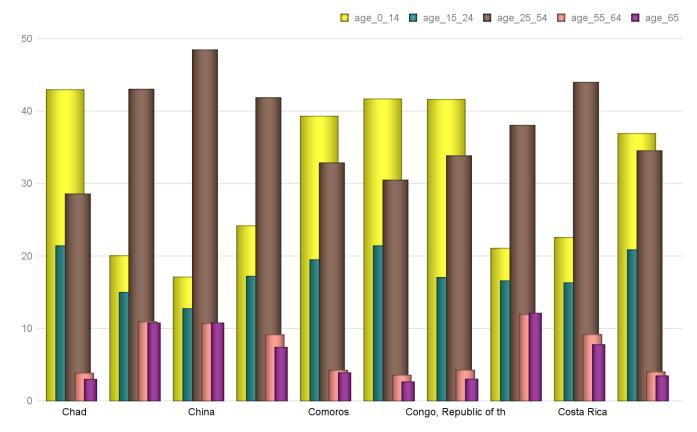

revision

int – number of this revision, incremented by Word each time the document is saved. Note however python-docx does not automatically increment the revision number when it saves a document.

Grafik Nº5

Altersverteilung für ausgewählte Länder nach WHO: Chad, Chile, China, Colombia, Comoros, Congo, Democratic Republic of the, Congo, Republic of the, Cook Islands, Costa Rica, Cote dIvoire

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

string – The topic of the content of the resource.

title

string - The name given to the resource.

version

Bericht Block Nº6

Text Block №6

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

Working with Text

To work effectively with text, it's important to first understand a little about block-level elements like paragraphs and inline-level objects like runs.

Block-level vs. inline text objects

Tabelle Nº6

Altersverteilung für ausgewählte Länder nach WHO: Croatia, Cuba, Curacao, Cyprus, Czechia, Denmark, Djibouti, Dominica, Dominican Republic, Ecuador

| | Gesamt Population | $\Delta Itoregruppon$ | | | | | |

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

A block-level item flows the text it contains between its left and right edges, adding an additional line each time the text extends beyond its right boundary. For a paragraph, the boundaries are generally the page margins, but they can also be column boundaries if the page is laid out in columns, or cell boundaries if the paragraph occurs inside a table cell.

A table is also a block-level object.

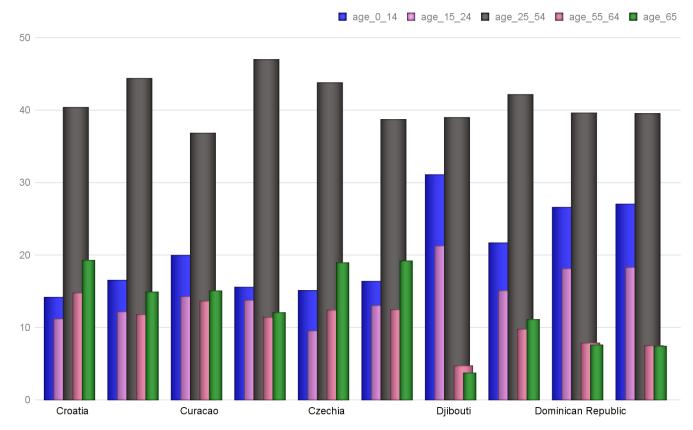

An inline object is a portion of the content that occurs inside a block-level item. An example would be a word that appears in bold or a sentence in all-caps. The most common inline object is a run. All content within a block container is inside of an inline object. Typically, a paragraph contains one or more runs, each of which contain some part of the paragraph's text.

The attributes of a block-level item specify its placement on the page, such items as indentation and space before and after a paragraph. The attributes of an inline item generally specify the font in which the content appears, things like typeface, font size, bold, and italic.

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

A paragraph has a variety of properties that specify its placement within its container (typically a page) and the way it divides its content into separate lines.

In general, it's best to define a paragraph style collecting these attributes into a meaningful group and apply the appropriate style to each paragraph, rather than repeatedly apply those properties directly to each paragraph. This is analogous to how Cascading Style Sheets (CSS) work with HTML. All the paragraph properties described here can be set using a style as well as applied directly to a paragraph.

The formatting properties of a paragraph are accessed using the ParagraphFormat object available using the paragraph's paragraph_format property.

Indentation

Indentation is the horizontal space between a paragraph and edge of its container, typically the page margin. A paragraph can be indented separately on the left and right side. The first line can also have a different indentation than the rest of the paragraph. A first line indented further than the rest of the paragraph has first line indent. A first line indented less has a hanging indent.

Indentation is specified using a Length value, such as , , or . Negative values are valid and cause the paragraph to overlap the margin by the specified amount. A value of None indicates the indentation value is inherited from the style hierarchy. Assigning None to an indentation property removes any directly-applied indentation setting and restores inheritance from the style hierarchy:

Tab stops

A tab stop determines the rendering of a tab character in the text of a paragraph. In particular, it specifies the position where the text following the tab character will start, how it will be aligned to that position, and an optional leader character that will fill the horizontal space spanned by the tab.

The tab stops for a paragraph or style are contained in a TabStops object accessed using the tab_stops property on ParagraphFormat:

Bericht Block №10

Text Block №10

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

>>> tab_stops

<docx.text.tabstops.TabStops object at 0x106b802d8>

A new tab stop is added using the add_tab_stop() method:

>>> tab_stop = tab_stops.add_tab_stop(Inches(1.5))

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

The space_before and space_after properties control the spacing between subsequent paragraphs, controlling the spacing before and after a paragraph, respectively. Inter-paragraph spacing is collapsed during page layout, meaning the spacing between two paragraphs is the maximum of the space_after for the first paragraph and the space_before of the second paragraph. Paragraph spacing is specified as a Length value, often using:

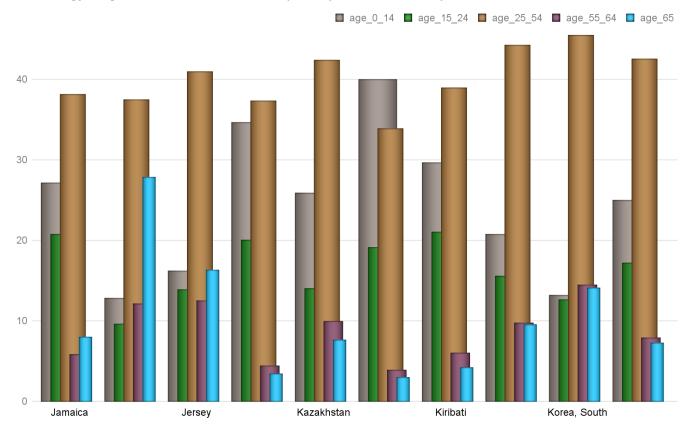

>>> paragraph_format.space_before, paragraph_format.space_after

(None, None) # inherited by default

12.0

Line spacing

Line spacing is the distance between subsequent baselines in the lines of a paragraph. Line spacing can be specified either as an absolute distance or relative to the line height (essentially the point size of the font used). A typical absolute measure would be 18 points. A typical relative measure would be double-spaced (2.0 line heights). The default line spacing is single-spaced (1.0 line heights).

Line spacing is controlled by the interaction of the and properties. is either a Length value, a (small-ish) float, or None. A Length value indicates an absolute distance. A float indicates a number of line heights. None indicates line spacing is inherited. line_spacing_rule is a member of the enumeration or None:

>>> font.size = Pt(12)

Many font properties are tri-state, meaning they can take the values True, False, and None. True means the property is "on", False means it is "off". Conceptually, the None value means "inherit". A run exists in the style inheritance hierarchy and by default inherits its character formatting from that hierarchy. Any character formatting directly applied using the object overrides the inherited values.

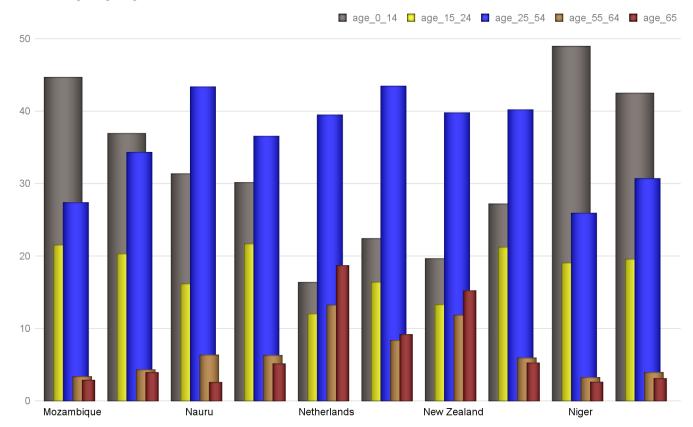

Bold and italic are tri-state properties, as are all-caps, strikethrough, superscript, and many others. See the API documentation for a full list:

Font color

Each object has a ColorFormat object that provides access to its color, accessed via its read-only color property.

Apply a specific RGB color to a font:

>>> from docx.shared import RGBColor

Text Block №17

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

A font can also be set to a theme color by assigning a member of the enumeration:

>>> from docx.enum.dml import MSO_THEME_COLOR

>>> font.color.theme_color = MSO_THEME_COLOR.ACCENT_1

A font's color can be restored to its default (inherited) value by assigning None to either the rgb or theme_color attribute of ColorFormat:

Determining the color of a font begins with determining its color type:

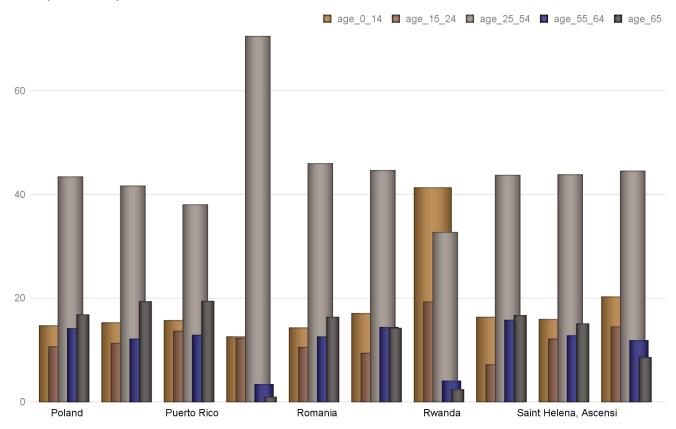

>>> font.color.type

RGB (1)

The value of the property can be a member of the enumeration or None. MSO_COLOR_TYPE.RGB indicates it is an RGB color. MSO_COLOR_TYPE.THEME indicates a theme color. MSO_COLOR_TYPE.AUTO indicates its value is determined automatically by the application, usually set to black. (This value is relatively rare.) None indicates no color is applied and the color is inherited from the style hierarchy; this is the most common case.

Working with Styles

This page uses concepts developed in the prior page without introduction. If a term is unfamiliar, consult the prior page for a definition.

Access a style

Styles are accessed using the Document.styles attribute:

Tabelle №18

<docx.styles.style._ParagraphStyle object at <0x10a7c4f6b>

Built-in styles are stored in a WordprocessingML file using their English name, e.g. 'Heading 1', even though users working on a localized version of Word will see native language names in the UI, e.g. 'Kop 1'. Because python-docx operates on the WordprocessingML file, style lookups must use the English name. A document available on this external site allows you to create a mapping between local language names and English style names:

User-defined styles, also known as custom styles, are not localized and are accessed with the name exactly as it appears in the Word UI.

| | © Dr. Alexander V | Vagner. All Right | ts Reserved | | | | |

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

>>> paragraph.style.name

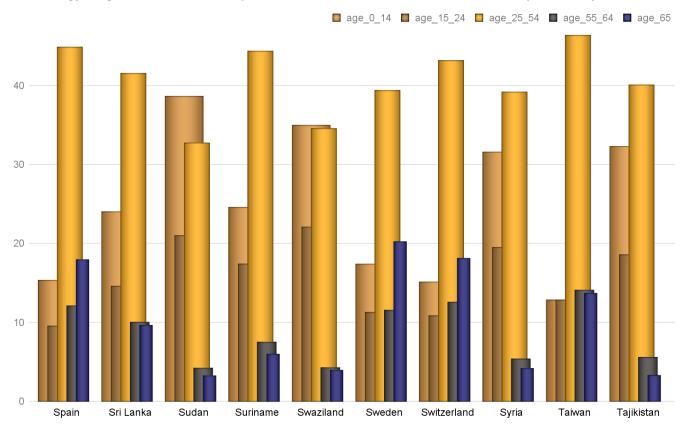

'Heading 1'

A style name can also be assigned directly, in which case python-docx will do the lookup for you:

>>> paragraph.style = 'List Bullet'

Altersverteilung für ausgewählte Länder nach WHO: Spain,Sri Lanka,Sudan,Suriname,Swaziland,Sweden,Switzerland,Syria,Taiwan,Tajikistan

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

 $<\!docx.styles.style._ParagraphStyle\ object\ at<\!0x10a7c4f84\!>$

>>> paragraph.style.name

 $'List\ Bullet'$

A style can also be applied at creation time using either the style object or its name:

Text Block №21

Hinweis: Alle Text Blöcke wurde vom Python-Dokumentation kopiert!

>>> paragraph.style.name

'Body Text'

>>> body_text_style = document.styles['Body Text']

>>> paragraph = document.add_paragraph(style=body_text_style)

Tabelle №21
